INTELLIGENCE BRIEF — FOR INTERNAL USE ONLY

Malaysia Energy Crisis

The Truth About Your Fuel, Gas & Food Prices

4 April 2026 | Updated: April 4, 2026

GEOSCIENTIST | 13 YEARS PETRONAS | SOVEREIGN ARCHITECT

Written by: Senior Exploration Geoscientist + AI Systems Architect

Not financial advice. Not government position.

350,000

Barrels of oil equivalent per day — Malaysia's ENTIRE domestic production

This is the number nobody in government is saying out loud

PART I — What Actually Happened

📺 Source: What the PETRONAS CEO Said on TV (April 3, 2026)

Tengku Muhammad Taufik appeared on RTM TV1 on April 3, 2026. He said: crude oil prices jumped 40% since late February, now around US$120 per barrel. Shipping costs up to 176% higher. Insurance costs up to 337% higher. Planning horizon shortened from 3 months to 45 days. "Alternative sourcing at relatively advanced stage."

⚠️ What He Didn't Say

The word "secured" implies confidence. But 350,000 boepd is our ceiling — not our buffer. Pengerang refinery runs on Saudi crude — not Malaysian crude. Thailand is already supplying our gas shortfall.

Feb 28, 2026

West Asia conflict escalates. Hormuz disruptions begin. About 20% of world oil supply route affected immediately.

Mar 10, 2026

Alternative shipping routes via Fujairah and Yanbu also disrupted. Insurance premiums spike globally.

Late 2025

Peninsular Malaysia crude production collapses to 350,000 boepd total — first reported by Economic Minister Rafizi Ramli.

April 3, 2026

> PETRONAS CEO on TV: "45-day planning horizon." Government says supply "secured until May."

PART II — The Numbers in Plain Language

Why 350,000 boepd Is a Crisis

Malaysia has about **34 million people**. Our refineries can process nearly **1 million barrels per day**. But our own fields produce only **350,000 barrels per day**.

That means we can only supply about **35-40%** of what our refineries need. The rest must come from overseas.

🚨 Why It's Getting Worse

This 350,000 boepd is not a temporary dip. It's the floor. Our old fields — Tapis, Bekok, Palas — have been producing for 40-60 years. Water is flooding through. No political promise can reverse geology. Without major new discoveries, this number keeps falling.

Our Refineries — Who Produces What

Refinery	Location	Capacity	Who Owns It
Malaysian Refining	Melaka	**270,000 bbl/d**	PETRONAS
Petronas Penapisan	Terengganu	**120,000 bbl/d**	PETRONAS
Pengerang (RSC)	Johor	**300,000 bbl/d**	PETRONAS + Aramco JV ⚠️
Hengyuan	Various	**156,000 bbl/d**	Independent
Petron	Melaka	**88,000 bbl/d**	Independent

⚠️ The Pengerang Problem

Pengerang is our biggest refinery. But it's a **joint venture with Saudi Aramco**. The crude it processes isn't Malaysian — it's Saudi. Getting that crude here now costs much

more due to Hormuz. So Pengerang is officially "Malaysian" but effectively **not contributing to our domestic supply security**. PETRONAS's "50% market share" claim excludes Pengerang's actual domestic benefit.

The Real Price of Oil — Not What You See on Screen

$120
SCREEN PRICE
per barrel (what you see on news)

+176%
SHIPPING COST JUMP
transport cost increase

+337%
INSURANCE SURGE
war risk premiums

$140–165

Per barrel — Malaysia's REAL delivered cost

Screen price + shipping + insurance + port + pipeline fees = US$20-45/bbl premium

PART III — The Food Connection (The Crisis You're Not Seeing Yet)

🚨 **What the CEO Said That Nobody Reported**

PETRONAS CEO mentioned: **>30% of world fertilizer supply** — urea, ammonia, potash, phosphate — transits the Strait of Hormuz. This is bigger than the oil price story.

Why This Matters for Your Food Bill

⚡ THE FERTILIZER CASCADE ⚡

↓ Hormuz disruption

→ Fertilizer shortage worldwide → **prices jump 40-60%**

→ Palm oil farmers cut fertilizer use → **yields drop**

→ Cooking oil prices spike **in 6-12 months**

→ Rice farmers affected too → **rice prices rise**

→ Chicken, meat, eggs → **feed costs rise**

→ Instant noodles, bread, everything → **cost of living jumps**

⚠ This hits in 6-18 months — not immediate

📌 **Historical parallel**

The 2008 food price spike — caused partly by fertilizer and energy costs — led to food riots in more than 30 countries. We're starting from a similar place in 2026. This is not fear-mongering. This is history repeating.

ASEAN — Who's Most Vulnerable

Country	Import Dependency	Hormuz Exposure	Overall Vulnerability
🇲🇾 **Malaysia**	HIGH (~65%)	HIGH (40% via Hormuz)	CRITICAL
🇸🇬 **Singapore**	VERY HIGH (100%)	HIGH	HIGH (but rich, has reserves)
🇹🇭 **Thailand**	MEDIUM (40%)	MEDIUM	Moderate
🇵🇭 **Philippines**	HIGH	MEDIUM	HIGH (poorest)
🇮🇩 **Indonesia**	LOW (energy exporter)	LOW	LOW — Net Beneficiary
🇻🇳 **Vietnam**	MEDIUM	LOW	LOW (coal-heavy)

✓ Indonesia Wins

Indonesia is the big winner here — coal exporter, gas exporter, energy self-sufficient. As prices spike, Indonesia actually profits. Malaysia does not have this luxury.

PART IV — Why Nobody Is Telling the Full Truth

The Gap Between What They Say vs. What's Real

WHAT THEY SAY

→ "Supply is secured until May 2026"

→ "We've shortened planning to 45 days" (as a positive)

→ "We're reducing dependency on oil revenue" (as a positive)

WHAT'S ACTUALLY TRUE

→ 45-60 days inventory, no buffer beyond that

→ Planning window shrunk because we have almost no buffer — not a strategy

→ "RM20 billion dividend — wise fiscal management"

→ "Alternative sourcing at advanced stage"

→ Transition narrative used to justify lower dividend, but we have neither money nor supply

→ RM20 billion is far less than RM30-40 billion historically — government underfunded

→ No specifics on which countries, which contracts — negotiation may be 10% done

⚠️ The Policy Trap

The government said "we're cutting oil dependency" AND faces an oil supply crisis AND has no real alternatives ready. All three are true simultaneously. You can't say "we don't need oil money" AND have an oil supply crisis AND have no backup plan. This is a **policy trap** — not PETRONAS's fault alone, but structural.

Why the CEO Can't Say More

Tengku Muhammad Taufik has a royal family connection — he has political cover. But he also has political constraints. He can't say "we're in trouble" without causing panic. He can't say "Pengerang isn't helping domestic supply" without embarrassing the Saudi partners. He can't say "build a strategic reserve now" without contradicting the Energy Transition narrative.

The WhatsApp conversation between experienced oil professionals captured it well: "*full with jargon, looks impressive, but doesn't say anything useful.*" That's not stupidity — that's political boxing.

PART V — What a Geologist Actually Sees

🚨 Why This Problem Can't Be Fixed in 45 Days

No political promise can reverse geology. The Tapis field has been producing since the 1970s. Its reservoirs are depleted. You can't negotiate your way to more oil in the ground.

The Geopolitical Reality

Approach	Time Required	Can It Help in This Crisis?
Find new oil field	3-7 years	❌ No
Develop a new discovery	5-8 years	❌ No
Build new gas pipeline	3-10 years	❌ No
Expand LNG terminal	2-5 years	❌ No
Build strategic oil reserve	6-18 months	⚠️ Yes, but must start NOW
Accelerate Sabah deepwater drilling	5-8 years	⚠️ Long term only
Switch to renewables for transport	20-30 years	❌ Not in time horizon

✓ The Uncomfortable Truth

The energy transition is real. But it's a 30-50 year project. The crisis is happening NOW. You cannot replace 350,000 boepd with solar panels in 5 years. It is physically impossible. Our old fields are depleting regardless of what politicians say.

PART VI — Four Scenarios, Four Futures

Scenario A: Things Clear Up

30%

Conflict de-escalates by May. Shipping reopens. Insurance drops 50%. Oil back to US$85-95. Supply secured. Life goes on.

Scenario B: Stalemate Q3 2026

25%

Low-intensity conflict continues. Oil US$100-120. Malaysia activates demand management. No rationing but noticeably higher prices for 6-12 months. Painful but manageable.

Scenario C: Serious Disruption

25%

Hormuz essentially closes. Ships refuse transit. Qatar voids LNG contracts. Malaysia declares energy emergency. Fuel rationing begins. This is the bad scenario.

Scenario D: Multi-Front Collapse

10%

Hormuz + South China Sea + Taiwan simultaneously. Global trade chaos. Oil US$150-180. Food crisis. Full national energy emergency. The civilization pressure scenario.

⚠️ Scenario D — The 10% Everyone Ignores

10% sounds low. In insurance terms: a 10% chance of a Catastrophe event is very high. In 2020, a "5% probability" event called COVID happened. In 1973, an oil embargo happened. Low probability ≠ won't happen.

PART VII — Five Things That Would Actually Help

1

Tell People the Truth

2

Activate Rationing Protocols Now

Public technical briefing with real 350,000 boepd figures, refinery utilization, and realistic timelines. Adults can handle the truth.

Fuel allowance for government, staggered work hours for businesses. Extends our buffer without panic. Better to prepare than scramble.

3

Renegotiate Pengerang JV

Saudi Aramco must give Malaysia first call on domestic supply at domestic prices. 0.3 m bbl/d can't sit idle when domestic supply is 350,000 boepd.

4

Build Strategic Oil Reserve NOW

Charter offshore floating storage. 30-day reserve = ~15 million barrels. Costs US$1-1.5 billion. Pays for itself the first real crisis.

5

Award Sabah Deepwater Blocks This Year

The only real near-term source of new domestic oil/gas. Boring and slow — but you have to start. Discovery to first oil = 5-8 years minimum.

⚡

The Truth About LNG

Worry about LNG more than oil. Qatar disruption → MLNG force majeure → Japan/Korea contracts breached → Malaysia's reputation destroyed. This is the silent crisis.

🔴 The Honest Bottom Line

Malaysia is in a more vulnerable energy position than the government has publicly admitted.

The 350,000 boepd figure, the 45-day window, the Pengerang problem, the Thai gas imports — all of these point to a country with less cushion than it should.

The conflict in West Asia is exposing a problem that was already there. We were told the energy transition would make us safer. That's true in the long run. The long run hasn't arrived yet.

The decisions that would actually help — truth-telling, rationing, renegotiating Pengerang, building a reserve — are all politically uncomfortable. They require leadership, not just administration.

Start the Sabah drilling conversations today. Begin the strategic reserve today. Tell the truth today.
